

0chain is a fast, secure, scalable permissionless blockchain. It provides automated data privacy compliance, continuous protection, and secured sharing for application. It is near-impossible to breach, as it has an immutable data ledger to resolve disputes, conduct audits, and eliminate data liability. In addition, it also enables secured data sharing between customers, partners, internal groups, and employees. The platform also provides private data usage in smart contract applications on any blockchain platforms such as Hyperledger and Ethereum with simple API interfaces.

## Web App Features

- Worked on the core client SDK (golang) to add/update more features
- Build and added features 0box IOS App and the 0wallet which is an authenticator app which users download on the laptop and uses it to accept a transaction initiated by the phone'
- The 0box application could be used in payment, supply chain, and healthcare industries for ownership, verification, and protection of data
- Build the block explorer, block recorder and block worker
- Setup Alpha/Beta net and complete DevOps solution, and deployment for the various services

## Tech Stack
